

Science Miracles

Science depends up on observation and replication. The scientific method is useful for studying nature but not super-nature. Miracles, such as Incarnation and the Resurrection, are by their very nature unprecedented events. Science simply cannot be the judge and jury as to whether or not these events occurred. In the society miracles is a phenomenon or an activity which seem unexplainable by the law of nature and that is why it is supposed to be supernatural in origin or described to be an act of God. Old faiths and believes, based on non- scientific prejudice and habits still persists and dominates scientific thinking in a large part of our society. Miracles are performed by so called Godmen who want to mislead the gullible, but fact is that all miracles are based on various principles of science. Godmen are always intended to talk about paranormal phenomenon like extrasensory perception, healing of diseases by supernatural powers etc.

The ultimate aim of the programme is to create local activists who can go to the field and expose prevalent blind beliefs in their area of work and help generate scientific temper among the masses. With the view the training module has been performed aiming at providing basic skills in performing & investigating such miracles. The miracles activities performed could be categorized as follows:

1. Hands on activities
2. Use of mechanical apparatus
3. Laws, properties and illusions of body
4. Chemical reactions
5. Learning by doing through discussion and explanation by experts.
